Task 1: Install Gitea and Push a Repository from the Ubuntu Server

Objective: Install and run a Gitea service on the Ubuntu server, create a local Git repository, and push it to a Gitea repository using HTTP over the loopback interface.

Steps Performed:

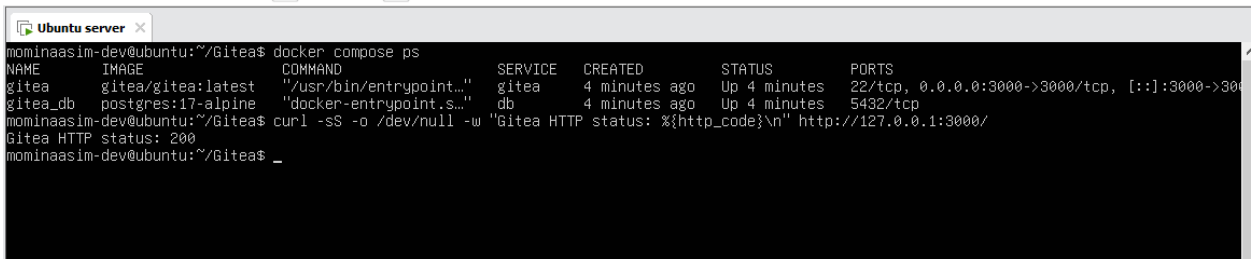

1. Installed Docker Engine and Docker Compose on the Ubuntu server using sudo apt install docker.io curl, then downloaded the Docker Compose CLI plugin from GitHub.
2. Started the Docker service and added the current user (mominaasim-dev) to the docker group; signed out and reconnected so the group membership took effect.
3. Verified installations:
    - git --version → git version 2.53.0
    - docker --version → Docker version 29.1.3
    - docker compose version → Docker Compose version 2.40.3
4. Cloned the instructor-provided Gitea repository from https://github.com/WaqasSaleem97/Gitea.git.
5. Started Gitea and PostgreSQL with docker compose up -d. Verified both containers were running with docker compose ps.
6. Confirmed Gitea was responding locally: curl http://127.0.0.1:3000/ returned **HTTP status 200**.
7. Opened Gitea in the browser at http://192.168.182.129:3000/ and completed the installation wizard with the required database settings:
    - Database type: PostgreSQL
    - Database host: db:5432
    - Database user: gitea

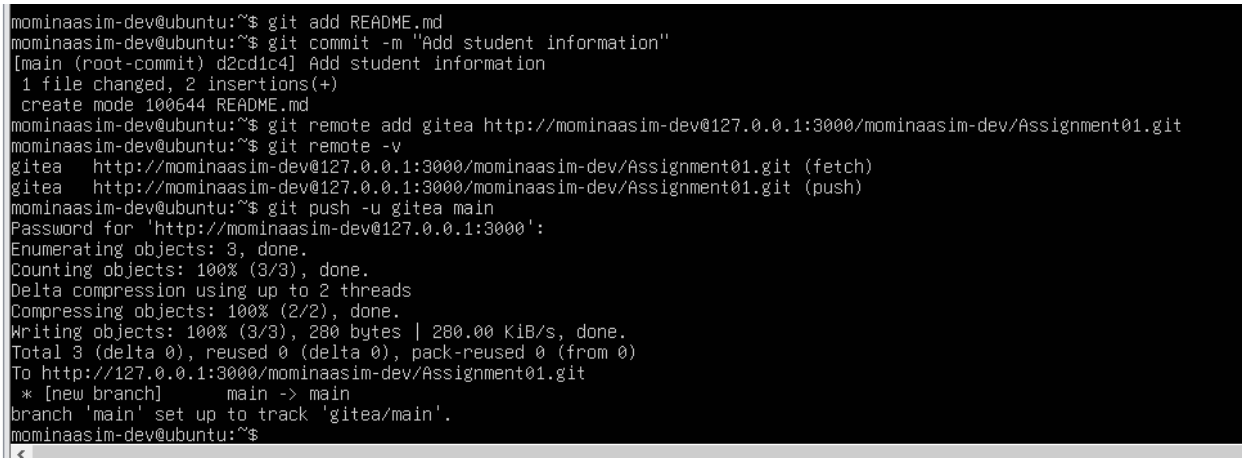

- Database password: gitea
- Database name: gitea
- Server domain: 192.168.182.129
- Gitea base URL: http://192.168.182.129:3000/

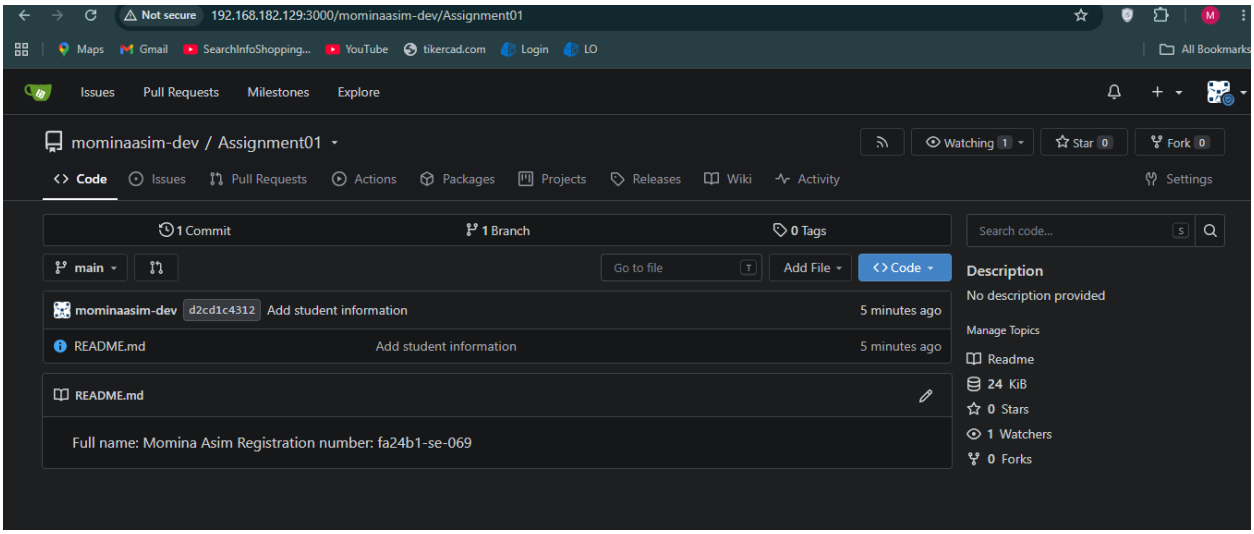

8. Created the Gitea administrator account and completed installation.
9. Created an empty public Gitea repository named **Assignment01** (no README, .gitignore, or license).
10. On the Ubuntu server, created a separate local repository at ~/Asignment01:
    - git init
    - git branch -M main
    - Created README.md with full name and registration number
    - git add README.md and committed with message "Add student information"
11. Generated a personal access token in Gitea (ubuntu-server-token) with write:repository scope.
12. Added the gitea remote without exposing the token in the URL:
    - git remote add gitea http://mominaasim-dev@127.0.0.1:3000/mominaasim-dev/Assignment01.git
    - Verified with git remote -v — no token visible in URL.
13. Pushed to Gitea with git push -u gitea main, using the token as the HTTP password when prompted.

Result: Gitea is running on the Ubuntu server; the local repository was successfully pushed to Gitea and is publicly accessible.

Screenshots:

Task 2: Push the Same Repository to GitHub

Objective: Add GitHub as a second remote to the same local repository and push the main branch.

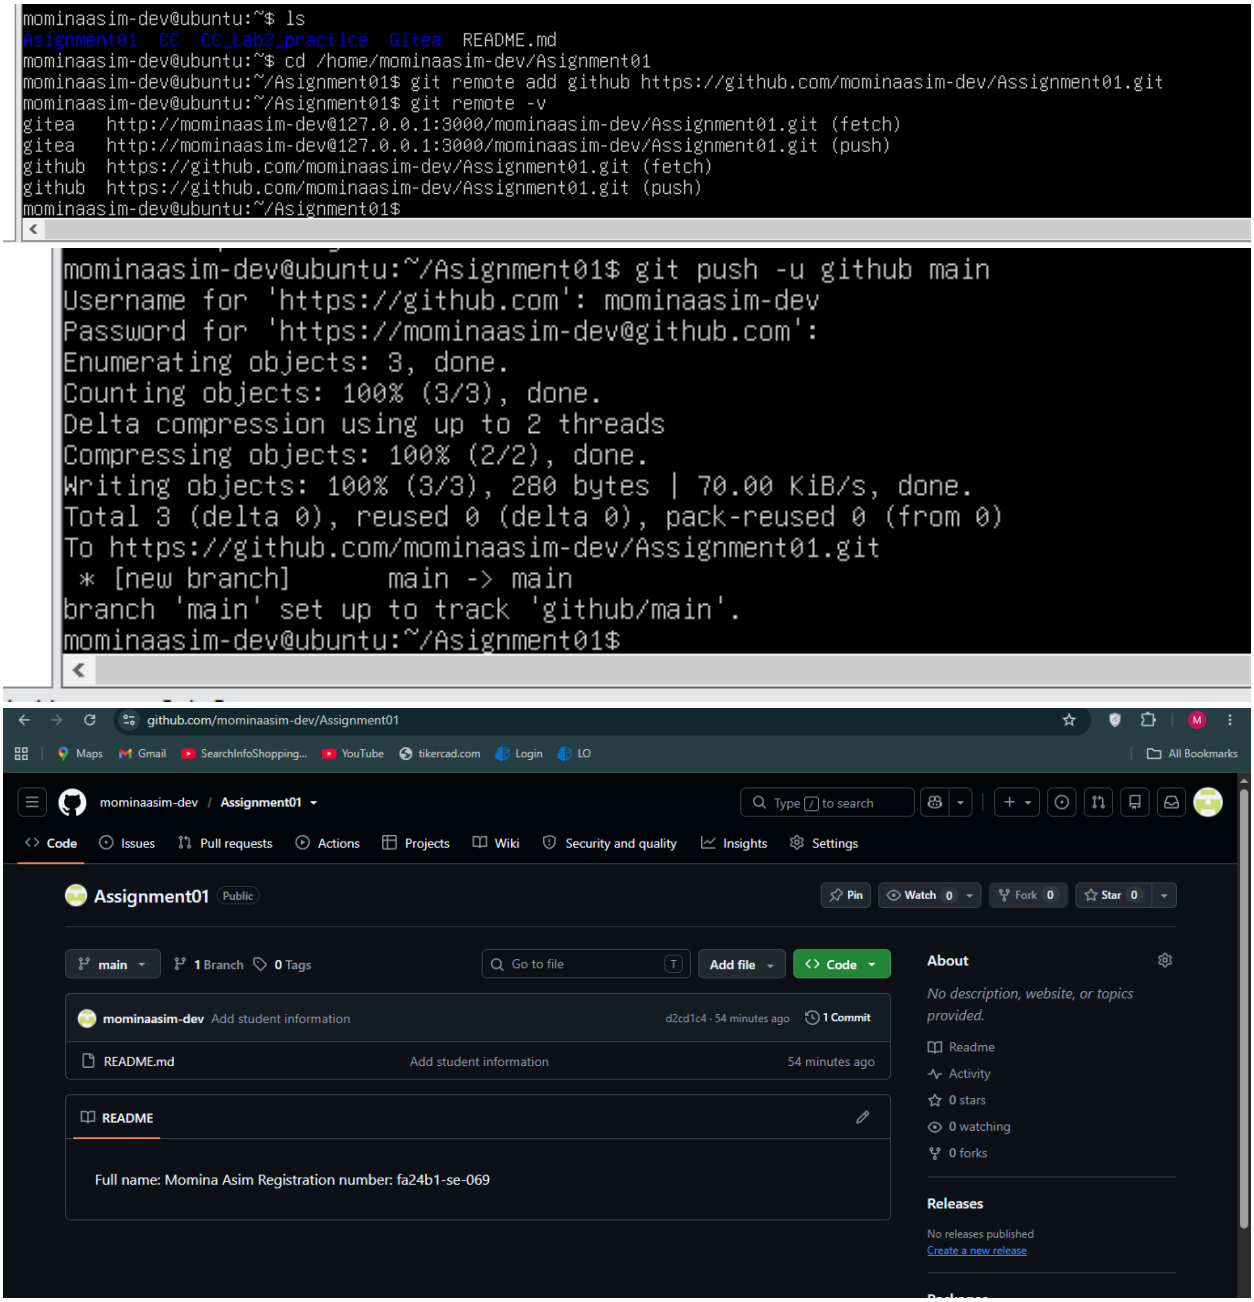

Steps Performed:

1. Created an empty **public** GitHub repository named **Assignment01** (no README, .gitignore, or license).

2. On the Ubuntu server, navigated to the existing local repo at ~/Asignment01.
3. Added GitHub as the second remote:
    - git remote add github https://github.com/mominaasim-dev/Assignment01.git
4. Verified both remotes with git remote -v — output showed both gitea and github remotes with fetch/push URLs and no tokens embedded.
5. Pushed to GitHub with git push -u github main, authenticating with a GitHub Personal Access Token.

Result: The same local repository is now connected to both Gitea and GitHub; the repository is publicly available at https://github.com/mominaasim-dev/Assignment01.

Screenshots:

Task 3: Track Three Large Files with Git LFS

Objective: Configure Git LFS, track three files larger than 100 MiB each, and push them to GitHub.

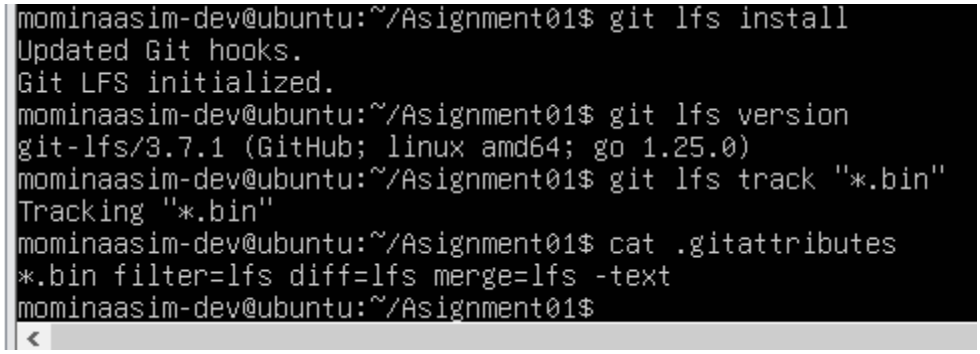

Steps Performed:

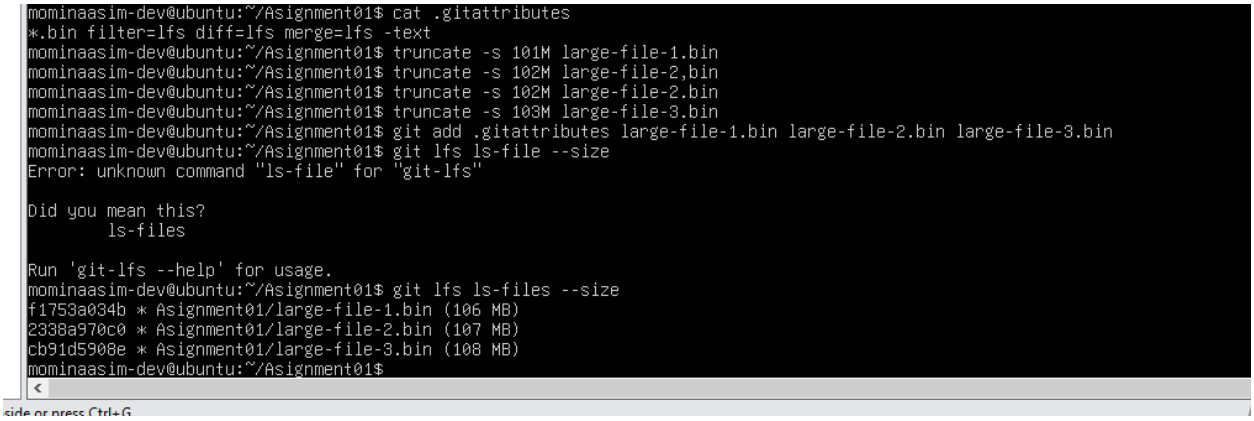

1. Navigated to the local repository: cd ~/Asignment01.

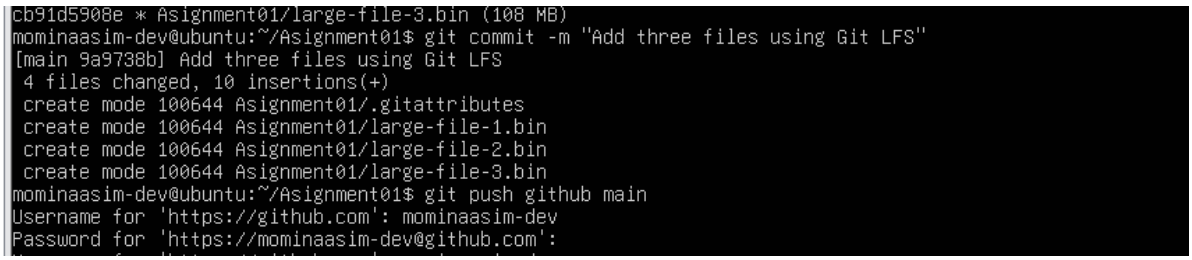

2. Initialized Git LFS and configured .bin tracking:
    - git lfs install → **Git LFS initialized.**
    - git lfs version → **git-lfs/3.7.1**
    - git lfs track "*.bin" → Tracking "*.bin"
    - cat .gitattributes → *.bin filter=lfs diff=lfs merge=lfs -text
3. Created three files larger than 100 MiB using truncate:
    - large-file-1.bin — 101 MB
    - large-file-2.bin — 102 MB
    - large-file-3.bin — 103 MB
4. Staged the files: git add .gitattributes large-file-1.bin large-file-2.bin large-file-3.bin
5. Verified LFS tracking with git lfs ls-files --size — all three files listed with sizes >100 MiB.
6. Committed with message "Add three files using Git LFS".
7. Pushed to GitHub with git push github main — the LFS upload completed at **100% (3/3)**.

Result: Three files larger than 100 MiB are tracked with Git LFS and successfully pushed to the GitHub Assignment01 repository.

Screenshots:

Task 4: Create a Portfolio or CV with GitHub Pages

Objective: Create a static portfolio website, host it in a public GitHub repository, and publish it via GitHub Pages.

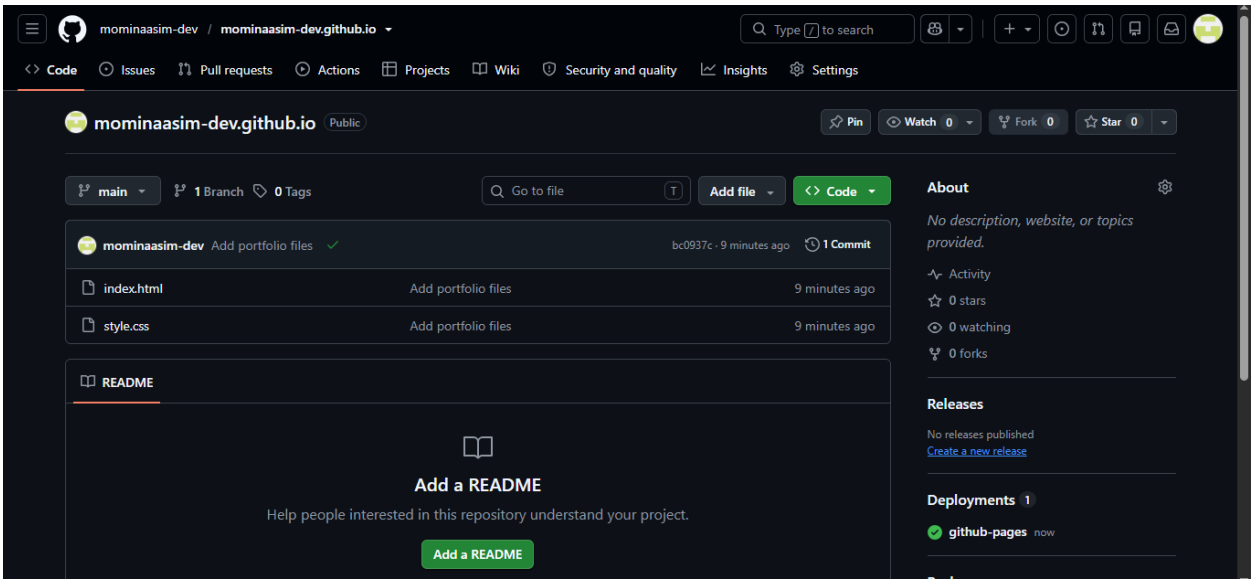

Steps Performed:

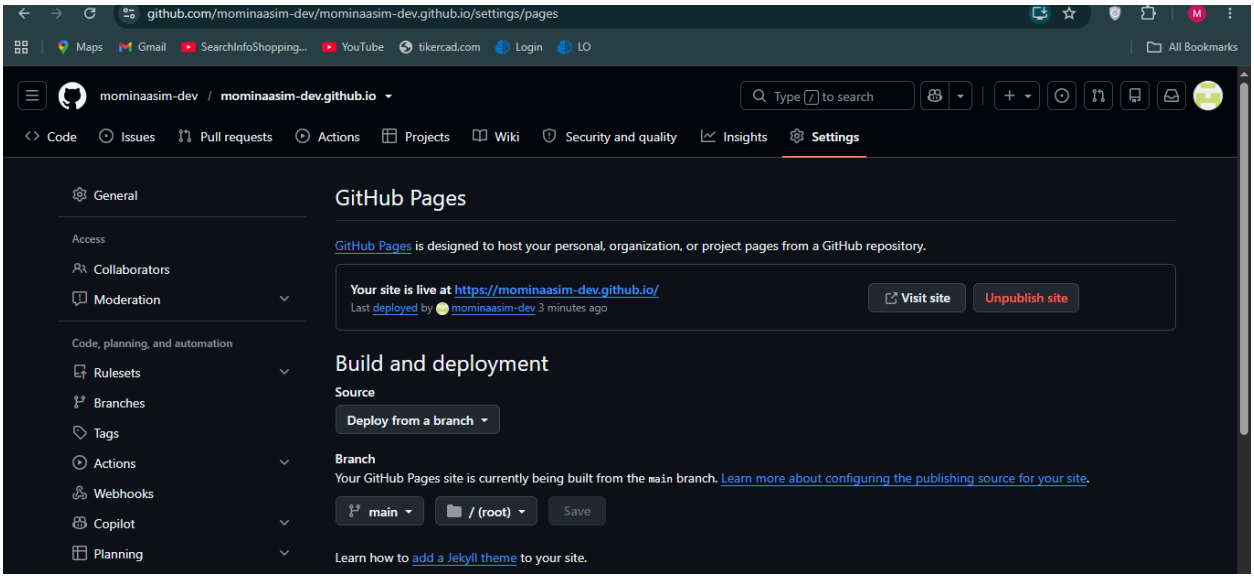

1. Created a new **public** GitHub repository named mominaasim-dev.github.io.
2. Built a portfolio site with two files:
    - index.html — containing sections: About Me, Education, Skills, Projects
    - styles.css — for styling

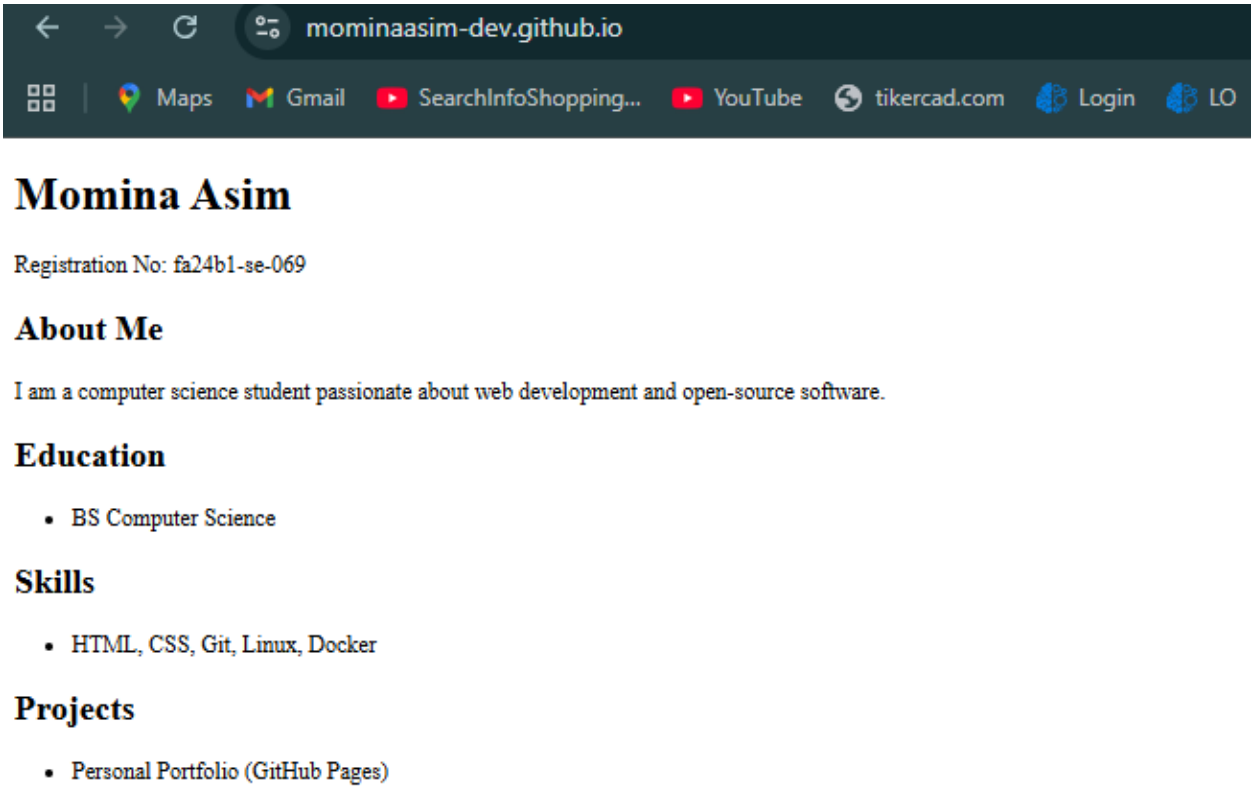

3. Committed and pushed the source files to the main branch.
4. Enabled GitHub Pages:
    - Settings → Pages → Build and deployment → Source: **Deploy from a branch**
    - Branch: **main** / **(root)**
    - Saved
5. Waited until GitHub reported: **"Your site is live at https://mominaasim-dev.github.io/"**
6. Opened https://mominaasim-dev.github.io/ and verified the portfolio loads correctly with all required sections.

Result: The portfolio is stored in a public GitHub repository and is published as a live GitHub Pages site at https://mominaasim-dev.github.io/.

Summary

This assignment covered:

- Installing and running a Gitea service on an Ubuntu server
- Performing Git work from the Ubuntu server with the GitHub identity visible
- Pushing the same local repository to both Gitea and GitHub using two remotes
- Configuring Git LFS and pushing three large files (>100 MiB each)

- Creating and publishing a portfolio with GitHub Pages
